Decision Trees

Learning outcomes

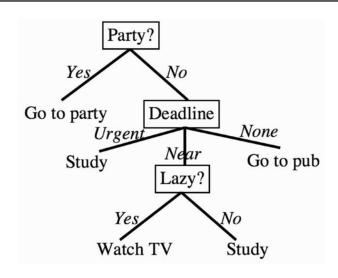

- Define the entropy of a set
- Compute the entropy of a given set
- Define the information gain for a given feature
- Define the Gini Impurity of a set
- Implement the ID3 and CART algorithms

Making Decisions

Differently from NNs, and most other ML methods, decision trees can work with non-metric data, that is, features that are not numbers.

Building a decision tree amounts to deciding the order in which the splits should be made.

How to choose the variable for each split?

Entropy and Information

Information: amount of a 'surprise' in an outcome with probability of p_i :

$$I_i = \log_2(\frac{1}{p_i}) = -\log_2(p_i)$$

Entropy: expected amount of 'surprise' in a probability

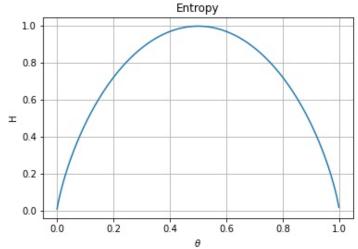

distribution:

$$H = E[I] = \sum_{i} -p_i \log_2(p_i)$$

Example: For a binary random variable

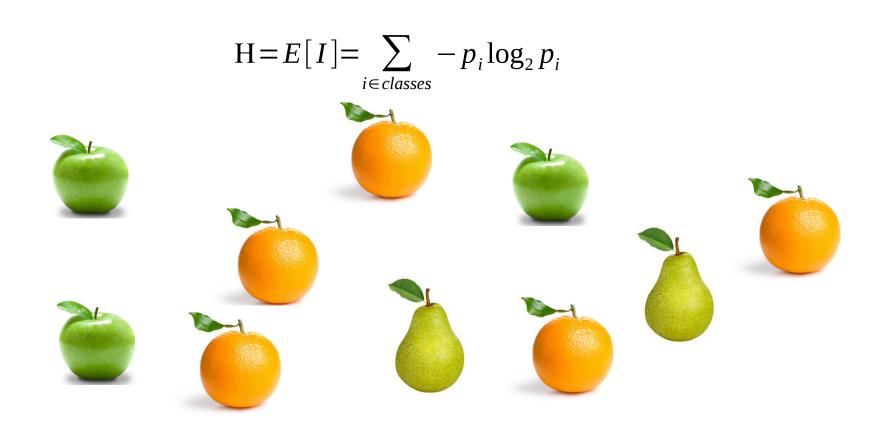

$$p(x = Head) = \theta$$

$$p(x = Tail) = 1 - \theta$$

Oranges & apples & pears

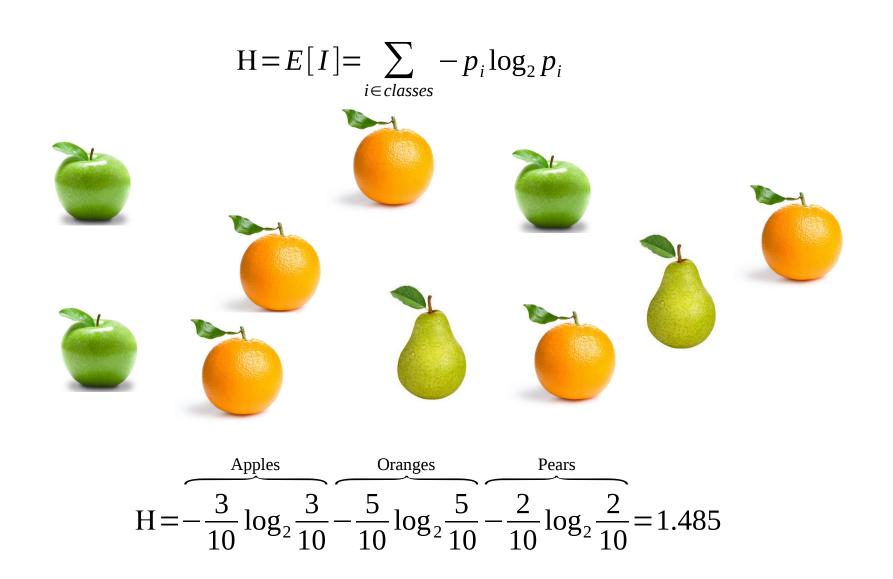

H=?
$$\log_a(x) = \frac{\log_b(x)}{\log_b(a)}$$

Oranges & apples & pears

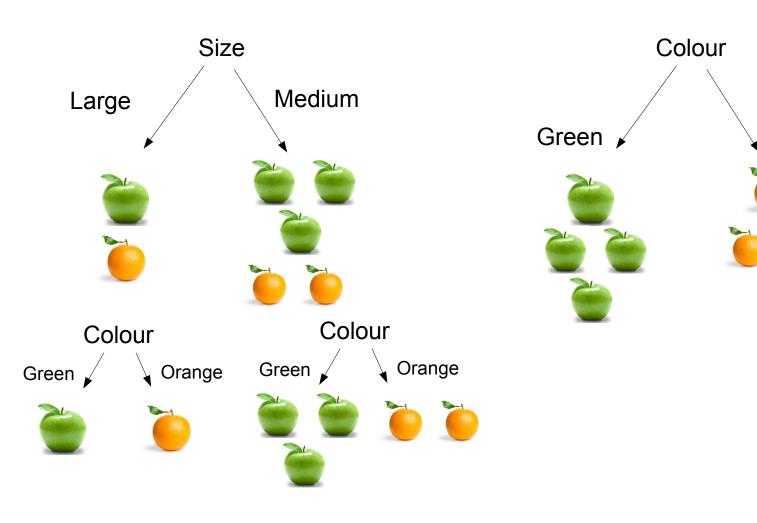

Splitting oranges and apples

Orange

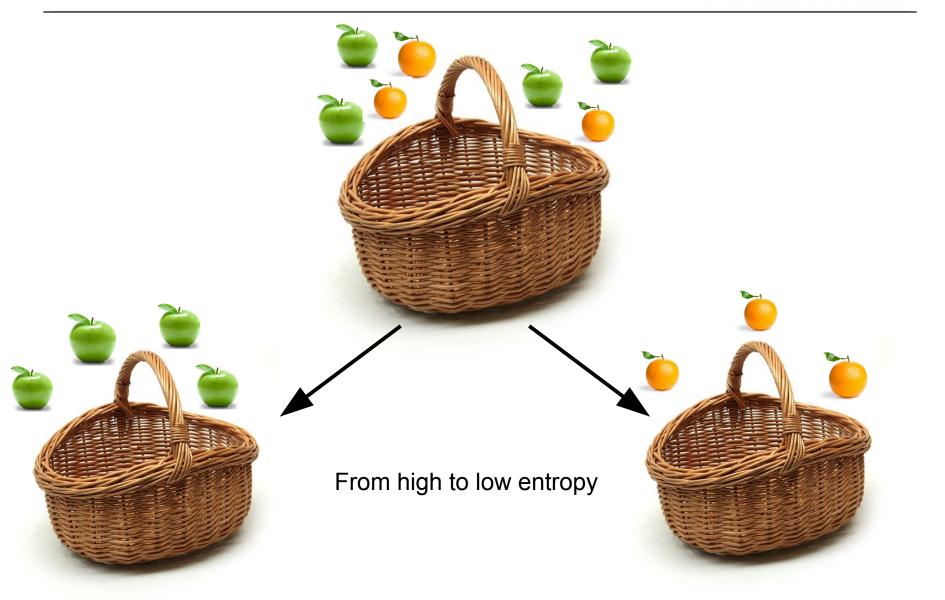

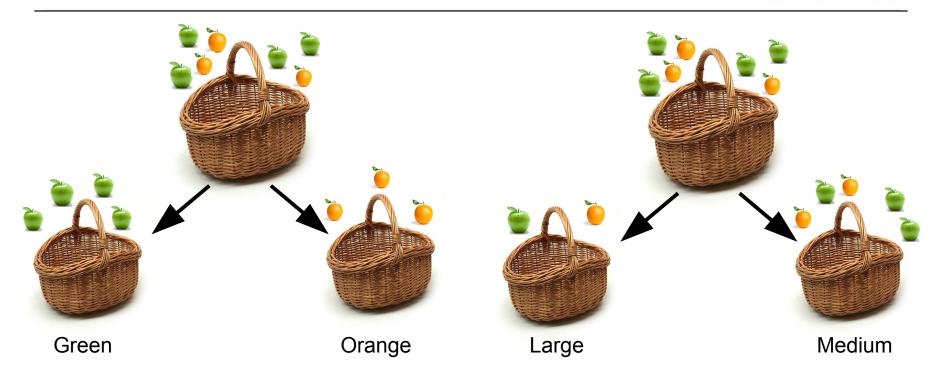

$$H = -p_O \log_2(p_O) - p_A \log_2(p_A) = -\frac{3}{7} \log_2(\frac{3}{7}) - \frac{4}{7} \log_2(\frac{4}{7}) = 0.985$$

$$H_{\text{colour}} = \underbrace{\frac{4}{7}}_{\text{fraction in Green}} \underbrace{\frac{3}{7}}_{\text{entropy of Green}} \underbrace{\frac{3}{7}}_{\text{fraction in Large}} \underbrace{\frac{1}{2} \log_2 \frac{1}{2} - \frac{1}{2} \log_2 \frac{1}{2}}_{\text{fraction in Medium}} \underbrace{\frac{1}{2} \log_2 \frac{1}{2} - \frac{3}{2} \log_2 \frac{3}{5}}_{\text{fraction in Medium}} \underbrace{\frac{1}{2} \log_2 \frac{1}{2} - \frac{3}{2} \log_2 \frac{3}{5}}_{\text{fraction in Medium}} \underbrace{\frac{1}{2} \log_2 \frac{1}{2} - \frac{3}{2} \log_2 \frac{3}{5}}_{\text{fraction in Medium}} \underbrace{\frac{1}{2} \log_2 \frac{1}{2} - \frac{3}{2} \log_2 \frac{3}{5}}_{\text{fraction in Medium}} \underbrace{\frac{1}{2} \log_2 \frac{1}{2} - \frac{3}{2} \log_2 \frac{3}{5}}_{\text{fraction in Medium}} \underbrace{\frac{1}{2} \log_2 \frac{1}{2} - \frac{3}{2} \log_2 \frac{3}{5}}_{\text{fraction in Medium}} \underbrace{\frac{1}{2} \log_2 \frac{1}{2} - \frac{3}{2} \log_2 \frac{3}{5}}_{\text{fraction in Medium}} \underbrace{\frac{1}{2} \log_2 \frac{1}{2} - \frac{3}{2} \log_2 \frac{3}{5}}_{\text{fraction in Medium}} \underbrace{\frac{1}{2} \log_2 \frac{1}{2} - \frac{3}{2} \log_2 \frac{3}{5}}_{\text{fraction in Medium}} \underbrace{\frac{1}{2} \log_2 \frac{1}{2} - \frac{3}{2} \log_2 \frac{3}{5}}_{\text{fraction in Medium}} \underbrace{\frac{1}{2} \log_2 \frac{1}{2} - \frac{3}{2} \log_2 \frac{3}{5}}_{\text{fraction in Medium}} \underbrace{\frac{1}{2} \log_2 \frac{1}{2} - \frac{3}{2} \log_2 \frac{3}{5}}_{\text{fraction in Medium}} \underbrace{\frac{1}{2} \log_2 \frac{1}{2} - \frac{3}{2} \log_2 \frac{3}{5}}_{\text{fraction in Medium}} \underbrace{\frac{1}{2} \log_2 \frac{1}{2} - \frac{3}{2} \log_2 \frac{3}{5}}_{\text{fraction in Medium}} \underbrace{\frac{1}{2} \log_2 \frac{1}{2} - \frac{3}{2} \log_2 \frac{3}{5}}_{\text{fraction in Medium}} \underbrace{\frac{1}{2} \log_2 \frac{1}{2} - \frac{3}{2} \log_2 \frac{3}{5}}_{\text{fraction in Medium}} \underbrace{\frac{1}{2} \log_2 \frac{1}{2} - \frac{3}{2} \log_2 \frac{3}{5}}_{\text{fraction in Medium}} \underbrace{\frac{1}{2} \log_2 \frac{1}{2} - \frac{3}{2} \log_2 \frac{3}{5}}_{\text{fraction in Medium}} \underbrace{\frac{1}{2} \log_2 \frac{3}{2} - \frac{3}{2} \log_2 \frac{3}{5}}_{\text{fraction in Medium}} \underbrace{\frac{1}{2} \log_2 \frac{3}{2} - \frac{3}{2} \log_2 \frac{3}{5}}_{\text{fraction in Medium}} \underbrace{\frac{1}{2} \log_2 \frac{3}{2} - \frac{3}{2} \log_2 \frac{3}{5}}_{\text{fraction in Medium}} \underbrace{\frac{1}{2} \log_2 \frac{3}{2} - \frac{3}{2} \log_2 \frac{3}{5}}_{\text{fraction in Medium}} \underbrace{\frac{1}{2} \log_2 \frac{3}{2} - \frac{3}{2} \log_2 \frac{3}{5}}_{\text{fraction in Medium}} \underbrace{\frac{1}{2} \log_2 \frac{3}{2} - \frac{3}{2} \log_2 \frac{3}{5}}_{\text{fraction in Medium}} \underbrace{\frac{1}{2} \log_2 \frac{3}{2} - \frac{3}{2} \log_2 \frac{3}{5}}_{\text{fraction in Medium}} \underbrace{\frac{1}{2} \log_2 \frac{3}{2} - \frac{3}{2} \log_2 \frac{3}{5}}_{\text{fraction in Medium}} \underbrace{\frac{1}{2} \log_2 \frac{3}{2} - \frac{3}{2} \log_2 \frac{3}{5}_{\text{fraction in Mediu$$

H = 0.985

 $H_{colour} = 0$

 $G(\text{Colour}) = H - H_{\text{colour}} = 0.985$

$$H_{\text{size}} = 0.98$$

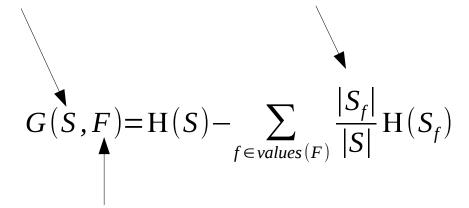

$$G(Size) = H - H_{size} = 0.005$$

Information gain

Set of elements

elements in S with feature F = f

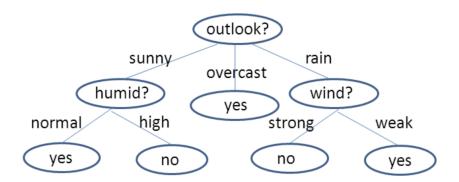

Feature

compare with:

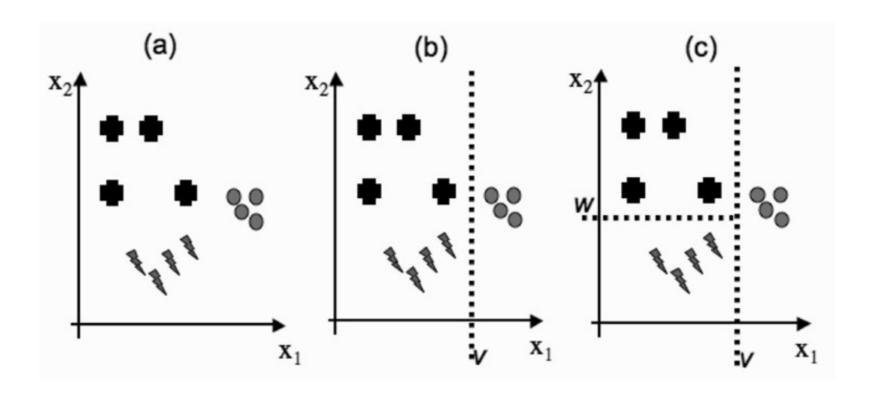

$$H_{\text{size}} = \frac{2}{7} \frac{2}{7} \left(-\frac{1}{2} \log_2 \frac{1}{2} - \frac{1}{2} \log_2 \frac{1}{2} \right) + \frac{5}{7} \left(-\frac{2}{5} \log_2 \frac{2}{5} - \frac{3}{5} \log_2 \frac{3}{5} \right) = 0.98$$

The ID3 algorithm

- It computes the information gain for each feature and chooses the one that produces the highest value.
- The output is the decision tree, with the decisions given in the leaves.

play	outlook	temp	humid	wind	day	moon

Characteristics of ID3:

- Does not capture the curvature in the decision boundries
- Greedy with respect to G (chooses max gain)→ potential local minimum
- Deals with noisy data (by assigning the label to most common class)
- Always uses all the features: Prone to overfitting (pruning is applied).
- Does not work with continuous variables (C4.5 algorithm does)

A Different Criterion: Gini Impurity

		Colour		
		Green	Orange	
Size	Large	P A P P	O	
	Medium	A A	O O	

$$G(S) = \frac{4}{10} \left(\frac{3}{10} + \frac{3}{10} \right) + \frac{3}{10} \left(\frac{4}{10} + \frac{3}{10} \right) + \frac{3}{10} \left(\frac{4}{10} + \frac{3}{10} \right) = \sum_{i}^{C} p_i (1 - p_i)$$

Gini split:

of classes
$$G(S) = \sum_{i}^{C} p_{i}(1-p_{i}) = \sum_{i}^{C} (p_{i}-p_{i}^{2}) = \sum_{i}^{C} p_{i} - \sum_{i}^{C} p_{i}^{2} = 1 - \sum_{i}^{C} p_{i}^{2}$$

$$G(S,F) = G(S) - \sum_{f \in values(F)} \frac{|S_f|}{|S|} G(S_f)$$

If we use the same definition of the information gain but with the Gini impurity instead of entropy we obtain the splitting principle of another algorithm: CART.

CART splits on the variable with the highest Gini gain, as opposed to information gain.

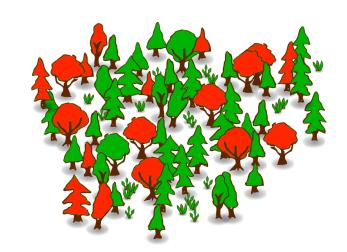

Random forests

Trees are often used in collections called (quite appropriately) forests. Each tree is obtained by introducing randomness in some aspects, the most commons are:

- bagging, a random subset of the data is used
- a random subset of the features is used.

Each tree "votes" for a classification, and the classification with most votes is returned by the forest.

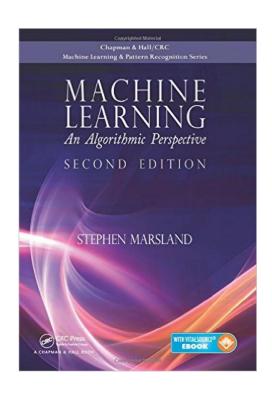

Conclusion

Learning outcomes

- Define the entropy of a set
- Compute the entropy of a given set
- Define the information gain for a given feature
- Define the Gini Impurity of a set
- Implement the ID3 and CART algorithms
